

Tujunga Watershed Project

Tujunga Watershed Project

TODAY'S AGENDA

- 6:00 - Introductions
- 6:10 - Agenda review & announcements
- 6:15 - Presentation of Existing Conditions Modeling
- 6:40 - Presentation of Proposed Projects - verify GPS points
- 7:00 - Review and discuss results of the Rough-cut for Project selection
- 7:20 - Break
- 7:30 - Review & discuss Data Gaps
- 8:20 - Next Steps
- 8:25 - Meeting Evaluation

Existing Conditions Modeling

Process and Projects to Date

Existing Conditions Modeling

OBJECTIVES

- Increase storm water retention
- Increase ground water recharge
- Improve water quality
- Restore hydrologic function while maintaining public safety

Existing Conditions Modeling

LSPC METHODOLOGY

Model Configuration

- Delineated subwatersheds (existing boundaries, topography, possible project locations)
 - Reclassified SCAG 2005 land use
 - Hydrology parameterization based on calibrated LA River model
- Major Assumptions**
- Exclusion of Lopez Dam (data gap)
 - Input flows from Pacoima Dam & Hansen Dam discharge (data gaps = average monthly flow)
 - 30% upstream flow lost to Pacoima Diversion Channel

Existing Conditions Modeling

PROJECT REPRESENTATION IN MODEL

Projects can be divided into two major categories

- Land Based** – Reduces surface runoff through increased infiltration on the land. Examples include:
 - Land use conversion
 - Reduction of impervious area
- Structural BMP** – Diversion and infiltration of flows within centralized facility. Examples include:
 - Spreading grounds
 - Detention pond/cistern

Each category includes specific assumptions for project evaluation of hydrologic benefits

Existing Conditions Modeling

LSPC DYNAMIC FLOW SIMULATION

Model predicts flows from each subwatershed

Model simulates 10 years of hourly flows

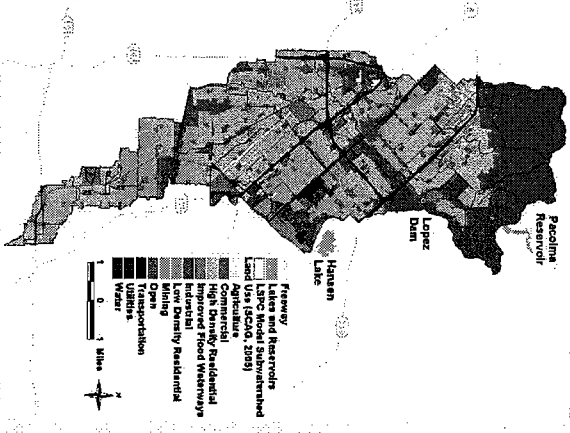

Output can be evaluated at various time scales

Existing Conditions Modeling

LAND USE

LAND USE	PERCENT OF TOTAL AREA
Agriculture	0.7%
Commercial	11.2%
High Density Residential	48.4%
Improved Flood Waterways	3.4%
Industrial	4.7%
Low Density Residential	4.3%
Mining	0.4%
Open	22.5%
Transportation	4.1%
Utilities	0.3%
Water	0.05%

Existing Conditions Modeling

MODEL ASSUMPTIONS FOR LAND COVER

Existing Conditions Modeling

STRUCTURAL DETENTION/INFILTRATION BMPs

- Design Assumptions for Structural BMPs:**
- Depth
 - Infiltration rate
 - Surface area
 - Watershed area/ inflow assumptions

Existing Conditions Modeling

REPRESENTING PROJECTS

- Assumptions Required:**
- Area of project
 - Soil infiltration rate
 - Land use
 - New conditions
 - New land use
 - New % impervious

- Assumptions Required:**
- Watershed area/ inflow assumptions
 - Design considerations

Existing Conditions Modeling

HYDRAULIC (HEC-RAS) MODELING

Existing Conditions - Topography

Existing Conditions Modeling

HEC-RAS MODEL SETUP

Existing Conditions Modeling

TUJUNGA WASH CHANNEL WIDTH = 70 ft

Existing Conditions Modeling

TUJUNGA WASH CHANNEL WIDTH = 60 ft

Existing Conditions Modeling

TUJUNGA WASH CHANNEL w/ LOW FLOW

Existing Conditions Modeling

DESIGN FLOW - DISCHARGES

Existing Conditions Modeling

LSPC INCREMENTAL FLOWS

Existing Conditions Modeling

LSPC FLOWS - ELEVATIONS

Existing Conditions Modeling

LSPC FLOW DISCHARGES

Existing Conditions Modeling

QUESTIONS???

Proposed TWP Projects

Process and Projects to Date

Decision Support System (DSS)

Development of DSS

Decision support system (DSS):

A process for identifying potential and proposed projects and programs likely to achieve the goals and objectives of the Tujungua Watershed Project

Decision Support System (DSS)

Development of DSS

Technical Advisory Committee (TAC)

- Inform and guide development of DSS

Steering Committee

- Further refinement of and consensus on DSS

Team Tujungua

- Organizational and analytical contributions

Decision Support System (DSS)

OUTLINE OF DSS

1. Develop Decision Criteria
2. Gather Project Proposals
3. Rough Scoring
4. Additional Info/Data Collection
5. Project Rating
6. Scenario Evaluation

Decision Support System (DSS)

DECISION CRITERIA

Goals and Objectives

Category A, Category B, Category C

Other Factors

feasibility, cost/benefit, visibility, innovation, synergy

Decision Support System (DSS)

DIAGRAM OF PROCESS

Decision Support System (DSS)

PROJECT PROPOSALS

Project Proposal Sources:

Steering Committee, neighborhood councils, agencies, TRP, other stakeholders

Project Survey Forms

essential information requested

Decision Support System (DSS)

ROUGH SCORING

Purpose

initial first-cut project ranking; for use in prioritizing analytical efforts during Project Rating phase

Method

project reviews by TAC; expertise in key subject areas evaluated 139 proposals utilizing rough scoring forms and guidance documents

Results

see tables on wall by Project # and Rough Score Rank summary by group (next slide)

Decision Support System (DSS)

ROUGH SCORING

Category	Total	Top 50	Bottom 50
Greenway	2	2	0
New Park - Pocket Park	11	9	1
Right of Way	3	2	1
New Park	14	9	2
Trails/Bike paths	18	8	6
Hansen Dam	8	3	2
Channel Retrofit	8	3	2
Street Retrofit	12	4	5
Spreading Grounds - Gravel Pits	12	3	5
Habitat	4	1	1
Parking Lot Retrofit	10	2	4
Park Retrofit	21	4	9
Big Tujunga Dam	4	0	3
Other	3	0	3
Freeway BMP	7	0	5
School Retrofit	2	0	1

Decision Support System (DSS)

ADDITIONAL INFO/ DATA

Essential information **not** received for most projects

Team Tujunga does not have sufficient resources

Need assistance from Steering Committee

- ... neighborhood councils, agencies, TAC, other SHS
- ... all project proponents!

If missing data not acquired, rough score stands

Decision Support System (DSS)

PROJECT RATING

Modeling

Projects Ready Now = 5

Key Missing Data
expected infiltration benefit, area estimates (from GIS)

Projects Ready w/ KMD = 5 + 16 = 21

GIS -> for Modeling and for GIS

Projects Feasible* Now = 60 (upon creation of shapefile)

Key Missing Data

project locations, individual shapfiles
Projects Feasible* w/ KMD = 60 + 42 = 102

* dependant on GIS analyst, prioritized by Rough Score

Decision Support System (DSS)

PROJECT RATING

Decision Support System (DSS)

SCENARIO EVALUATION

Evaluate Scenarios with different collections of projects, according to multiple priority schemes

Sum ranking points for projects in each scenario

Dynamic modeling of top 1-3 scenarios

Decision Support System (DSS)

PROCESS

QUESTIONS??

Decision Support System (DSS)

ADDITIONAL GIS MEASURES

Decision Support System (DSS)

ADDITIONAL GIS MEASURES

HABITAT ENHANCEMENTS

- Restored or Daylighted Streams (length in ft)
- Invasive Plants Removed (in acres)
- Native Vegetation Planted (sq.ft.)

Decision Support System (DSS)

ADDITIONAL GIS MEASURES

IMPROVEMENTS ON THE NETWORK OF PARKS

- Habitat corridor linkage (Y or N)
- Park/Open Space Creation or Preservation (in acres)
- Number of linkages w/ existing trails
- Park needs assessment (Send to TPL Greenprinting Model)

Photo courtesy of Mario Azevedo, LADWP

Decision Support System (DSS)

ADDITIONAL GIS MEASURES

REDUCTION IN H2O IMPORTS

- Infiltration potential (in/hr)
- Size of drainage area (sq. ft.)
- Impervious to pervious conversion (sq.ft.)
- Median/curb retrofits (linear ft)

Photo courtesy of Mario Azevedo, LADWP

Park Equity Map

Decision Support System (DSS)

ADDITIONAL GIS MEASURES

TRAILS CONNECTIVITY

- Number of existing trail linkages
- Number of park/open space connections
- Trail length (km)
- Trail length through underserved communities (km)
